OBJECTIVE

3rd-year BS Cybersecurity student at GIKI with hands-on experience building agentic AI workflows, deploying NLP models to production, and working inside a real healthcare environment. Passionate about applying AI to digitize public institutions, improve access to essential services, and create measurable impact for underserved communities. Seeking a summer internship where technology is used to solve problems that matter.

EDUCATION

Ghulam Ishaq Khan Institute (GIKI)

BS Cybersecurity, 3rd Year

2023 – 2027

WORK EXPERIENCE

Networking Intern, Ayub Medical Hospital, Abbottabad

Summer 2025

- Worked inside a live public healthcare environment, configuring and maintaining network infrastructure across hospital departments, gaining direct exposure to how digital systems support critical health services and patient care.
- Implemented firewall policies and network security controls to protect sensitive patient health records, understanding firsthand how technology failures in public health settings have real human consequences.

AI & CYBERSECURITY PROJECTS

LangGraph Multi-Agent Research Assistant

- Built a 4-agent AI system (Clarity, Research, Validator, Synthesis) using LangGraph with conditional routing, human-in-the-loop interrupts, Tavily search integration, and multi-turn conversation memory, end-to-end agentic workflow from query to structured output.
- Deployed a React chat interface with real-time agent status tracking, clarification prompts for ambiguous queries, and FastAPI backend with session management.

AI-Based Phishing Email Detection System

- Fine-tuned DistilBERT (HuggingFace) on a phishing dataset; achieved 94% precision and 91% recall on a 5,000-email test set, protecting everyday users from social engineering attacks that disproportionately target low-literacy and non-technical populations.
- Deployed end-to-end Streamlit web app for real-time inference with dual modes, full transformer model and lightweight heuristic fallback.

GIKI Timetable System

- Digitized the timetabling process for a 12-department, 48-batch public engineering institution, replacing a manual, error-prone process with an automated full-stack system that generates clash-free schedules across 52 rooms instantly.
- Custom 3-phase scheduling algorithm (Graph Coloring + CSP Backtracking + Soft Optimizer) with 18 REST API endpoints and PDF export, a direct example of AI-powered digitization of a public institution's core operations.

SecureVerse, Decentralised Identity & Secure Communication Platform

- Built a full-stack decentralised identity platform with 3-factor authentication (blockchain DIDs on Ethereum Sepolia, TOTP 2FA, RS256 JWT) and end to end encrypted messaging designed to eliminate centralised credential honeypots that put vulnerable users at risk.
- Performed threat modelling using IRIS and STRIDE, static analysis with Bandit and Pylint, and dynamic security testing via Postman, verified resistance to 20 attack vectors.

LoRaWAN Network Security Analysis (Ongoing Research)

- Identifying LoRaWAN vulnerabilities, replay attacks, join weaknesses, encryption gaps, and proposing protocol enhancements for resource-constrained IoT networks used in public infrastructure and healthcare monitoring systems.

TECHNICAL SKILLS

AI / ML: LangGraph, LangChain, RAG, AI Agents, DistilBERT / HuggingFace, TensorFlow, PyTorch, NLP, Model Evaluation

Languages: Python, C++, SQL, JavaScript — OOP, Data Structures & Algorithms

Web & Dev: React, FastAPI, Flask, Streamlit, OpenCV, Git, Linux / Windows, SQLite, PostgreSQL

Security: Cryptography (AES-256, Blowfish, 3DES), Network Security, Firewall Config, LoRaWAN, Penetration Testing

ACHIEVEMENTS

- Vice President, Netronix (Networking & Gaming Society, GIKI) — managing internet and Wi-Fi infrastructure across 13 hostels, troubleshooting network issues, and organizing society events.
